

Is there a way to stop an item running midstream without killing it and taking it out of the log?

There is an option for this, you can pause a running item and then re-cue it.

Here are the steps:

1. Here we see a running item. Click on the PTA button on the left. This will pause the item and stop it from playing.

2. Now that the item is paused, press the RECUE button on the right hand side. This will reset the play position to the beginning and have it cued up for playback later.

This will save you from having to use the Full Log to move the item around.

Note:

If the pause does not work, you may have to enable the feature in the On Air settings.

In the On Air config under the Log Options section make sure that the Disable Screen Pause is not check marked.
